

FAS Front-end Development

The FAS Front-end Development Team (FED) owns the design system code and its support structure with UX and IT. They also lead best-in-class front-end code architecture and processes.

Component Overview

A code-agnostic system

To create a foundation of consistency across FAS, the component library was built to be code and framework agnostic for the following reasons:

- FAS components are separate from the app technical stack.
- The FAS system doesn't limit the JavaScript framework that must be used by developers. This future proofs against any new and better frameworks, or security mandates.
- The component library can be iterated on in one place and then used throughout all the digital products in FAS, independent of technical requirements. Component code framework is shared between Angular, Vue, and AEM.
